

## APPENDIX A: Monitoring Glycemia and Insulin Requirements: Immediate Postpartum and Post Discharge (consensus suggestions)

Diabetes Type	IMMEDIATE POSTPARTUM (1 TO 3 DAYS)			POST DISCHARGE	
	MONITORING GLYCEMIA		INSULIN REQUIREMENTS	MONITORING GLYCEMIA	INSULIN REQUIREMENTS
	Capillary	Venous/A1C	Insulin	Capillary/Venous/A1C	Insulin
<b>Type 1</b>	<ul style="list-style-type: none"> <li>Monitor every 2-4 hours until eating; then qid (ac meals and hs snack – 2200 hours) plus 0300 hours for 3 days</li> <li>Diligent checking while diabetes in flux</li> </ul>	<ul style="list-style-type: none"> <li>No need</li> </ul>	<ul style="list-style-type: none"> <li>Decrease basal to 1/3 of current dose or 1/2 of pre-pregnancy dose.</li> <li>Decrease CHO:insulin ratio (e.g., 1 unit/15 g CHO or 1 unit/20 g CHO).</li> <li>As insulin resistance returns, titrate up appropriately.</li> </ul>	<ul style="list-style-type: none"> <li>Capillary monitoring more frequent in presence of breastfeeding.</li> <li>A1C q 3-6 months, as per usual care.</li> </ul> <p><i>Note: Diabetes is not new to this population. Within one week, expect resumption of self-management behaviors.</i></p>	<ul style="list-style-type: none"> <li>As insulin resistance returns, titrate up appropriately.</li> </ul>
<b>Type 2</b>  (This represents a spectrum of patients where management in the pre-pregnancy and pregnancy periods can vary from lifestyle only to MDI)	<ul style="list-style-type: none"> <li>Monitor every 2-4 hours until eating; then qid (ac meals and hs snack – 2200 hours) plus 0300 hours while in hospital</li> </ul>	<ul style="list-style-type: none"> <li>No need</li> </ul>	<ul style="list-style-type: none"> <li>Due to increased insulin sensitivity, hold or reduce insulin.</li> <li>The pre-pregnancy treatment regimen may help to guide the post pregnancy treatment; i.e., the more agents/insulin prior to pregnancy will predict the likelihood of requiring insulin after.</li> </ul>	<ul style="list-style-type: none"> <li>Capillary testing will be required to determine the adequacy of the treatment plan; then as per usual care.</li> <li>A1C q 3-6 months, as per usual care.</li> </ul>	<ul style="list-style-type: none"> <li>The postpartum therapy will most likely equal the pre-pregnancy therapy.</li> <li>In general, if the woman is not breastfeeding, she will require, at the very least, the therapy that she used prior to pregnancy.</li> </ul>
<b>GDM</b>  • Insulin requiring	<ul style="list-style-type: none"> <li>qid (ac meals and hs snack) for 24 hours                             <ul style="list-style-type: none"> <li>If normal, stop</li> <li>If elevated, continue qid until discharge</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>No need</li> </ul>	<ul style="list-style-type: none"> <li>Stop insulin</li> </ul>	<ul style="list-style-type: none"> <li>6-week OGTT</li> </ul> <p><i>Note: If breastfeeding, the OGTT may be normal. Repeat post breastfeeding.</i></p>	N/A
	<ul style="list-style-type: none"> <li>For suspected type 2 DM, if pre-meal values &gt; 10 mmol/L, continue qid</li> </ul>	<ul style="list-style-type: none"> <li>A1C not helpful, as A1C reflects control during pregnancy</li> </ul>	<ul style="list-style-type: none"> <li>Hold insulin (no immediate harm to mother or baby)</li> <li>If blood glucose remains elevated, consider metformin or basal insulin and adjust accordingly.</li> </ul>	<ul style="list-style-type: none"> <li>Capillary testing will be required to determine the adequacy of the treatment plan; then as per usual care.</li> <li>A1C cannot be used to guide care until &gt; 3 months.</li> </ul>	<ul style="list-style-type: none"> <li>Depends on post pregnancy dysglycemia.</li> </ul>
• Non-insulin requiring	<ul style="list-style-type: none"> <li>No post delivery testing required</li> </ul>	<ul style="list-style-type: none"> <li>No need</li> </ul>	N/A	<ul style="list-style-type: none"> <li>6-week OGTT</li> </ul>	N/A
